

Farah Origin | Project Documentation

Welcome to the official documentation for **Farah Origin**, an Aesthetic Crochet & Henna Atelier platform. This document outlines the architecture, features, and deployment pipeline for the Next.js web application and Android APK.

1. Project Overview

Farah Origin is a modern e-commerce and portfolio application designed to showcase and sell handcrafted crochet and henna products. It features a stunning, premium user interface (UI) and a fully functional Admin Dashboard for managing inventory and orders.

Core Features:

- **Aesthetic UI/UX:** Clean glassmorphism design, smooth framer-motion micro-animations, and a premium typography pair (Inter for UI, Playfair Display for headings).
 - **E-Commerce Checkout:** Cart management, dynamic stock validation, and Razorpay integration (with UPI, Card, and Netbanking support).
 - **Admin Dashboard (/admin):** Real-time order tracking, comprehensive analytics, order details modals, and search/filtering capabilities.
 - **Cross-Platform:** Available as a responsive web app and a native Android APK (built via Capacitor).
 - **Automated Notifications:** Live email order confirmations sent to customers via Nodemailer.
-

2. Tech Stack

- **Frontend:** Next.js 16 (React 19)
 - **Styling:** Tailwind CSS + Framer Motion
 - **Backend / API:** Next.js API Routes (Serverless)
 - **Database:** Supabase (PostgreSQL)
 - **Mobile App:** Capacitor & Android Studio (Native APK)
 - **Email:** Nodemailer
-

3. Visual Gallery & Screenshots

Here is a visual overview of the application:

(Note: Since the site is now live on your phone via the APK, you can also take screenshots directly from your device!)

4. Application Architecture

API Routes (app/api/)

- POST /api/checkout/create-order: Initializes a Razorpay payment order.
- GET/POST/PUT /api/orders: Fetches orders, places a new order (validates stock), and updates order status (Admin only).

- POST /api/auth/register: Upserts a user in Supabase and returns an encrypted JWT cookie.
- POST /api/auth/send-otp: Sends a login verification code via SMS (Fast2SMS/Twilio) and Email (Nodemailer).

Key Pages (app/)

- /: The hero landing page showcasing the brand.
 - /view-collection: The shop page where users can browse and add items to the cart.
 - /checkout: A multi-step secure checkout process (Login -> Address -> Summary -> Payment).
 - /admin: A protected dashboard for the store owner to view revenue, filter orders, and check stock.
-

5. Deployment & Build Pipeline

Web Deployment (Vercel)

The web application is continuously deployed to Vercel. - **Production URL:** <https://farah-origin.vercel.app> - **Environment Variables:** All secrets (Supabase keys, Email passwords) are securely injected via Vercel's Environment settings.

Android APK Build Process

To generate a new Android app update, the project uses a custom Node script (scripts/build-apk.js) executed via: `npm run apk:export`

What this script does: 1. Temporarily hides server-side API routes (since the APK must be fully static). 2. Runs `next build` to generate static HTML/JS in the `out/` folder. 3. Syncs the static assets to the Android folder using `@capacitor/android`. 4. Compiles the native Android project via `gradlew assembleRelease`. 5. Restores the API routes and outputs `farah-origin.apk` into the `public/` folder so it can be downloaded at `/download`.
